Consultar: Opciones de recompensaQ: Does TDE encrypt system store on HSM? I am working on a enterprise deployment of EMC ECS 3.0, I am planing to store the data on one HSM along with the TDE database and recovery key (random seed). I will be using a token to encrypt the disk. I have been reading on TDE and HSM and I am confused regarding what happens to the encrypted data, I understand that the TDE would store on disk the master key and recovery key (random seed). Are those two key stored on HSM in any way? I want to be sure that the security of TDE is not compromised if a hacker gets hold of a HSM in which case he can decode the TDE data. I need to encrypt the data on the disk in which case I assume the data will be encrypted using the encryption key stored in TDE. Since TDE will be stored on disk are the encryption keys also stored in HSM? Is there any benefit of storing both the encryption key and recovery key on the HSM? A: TDE encrypts the data on disk and stores the master key in the HSM. The TDE master key is also used to encrypt the data (both in memory and on disk). TDE randomizes the master key so that it can't be brute forced. The HSM does not know the master key or any other part of the TDE key hierarchy, so no one can recover the TDE keys without the recovery key. The TDE recovery key is never used. The TDE recovery key exists to handle the case where someone steals the TDE master key. It also makes TDE harder to attack (using timing). HSA storage is transparent to TDE. TDE and HSA store are two separate technologies that can be used together or separately. HSA is a fully homomorphic encryption (FHE) product, which means that one ciphertext can be combined with arbitrary plaintexts 82157476af
